

Remember...

if you ask the driver to add 10 more litres of water to a cubic metre of properly designed concrete:

www.hanson.com

- you **increase** the slump by about 20mm
- you **reduce** the compressive strength by as much as 3 N/mm²
- you **waste** the effect of 15 kg of cement per cubic metre.
- you **increase** the shrinkage potential about 10 per cent
- you **increase** the possibility of seepage through the concrete by up to 50 per cent
- you **decrease** the freeze thaw resistance by up to 20 per cent
- you **decrease** the resistance to attack by de-icing salt

That's why we ask you to sign for more water!

If you would like your concrete at a higher slump please contact the sales team who will be happy to arrange a more suitable concrete for you.
